

Launching Ansible Controller & Managed Nodes

- We need three Nodes/Servers for best practice
- They are for:
 - One for Ansible Controller - where we install Ansible Community or Ansible-Core
 - I will use CentOS which is from WSL2 as Ansible Controller Node, will see in next video
 - Two for Ansible Managed Nodes
 - You Just Launch these two nodes from your favorite Cloud or VMWare
 - Best Practice is select one Node as RHEL and another one as Ubuntu
- Note: Make sure that Port 22 is opened all nodes/servers as ansible communicates with Managed Nodes using ssh , for that 22 port must be opened
