

# Working With Ansible using your userId & Password

- Assume that you joined into an organization for a project then you will be assigned with some userId.  
Example: abc123
- You must raise access for your project servers
- Access team provides the access for the servers for your userId
  - userId : abc123
  - Password: abc123
- Assume that someone is using ansible for your project, and you wanted to use ansible at-least for basic operations like
  - To Distribute files to all your servers / project servers
  - To Find the java version on all your servers
  - To know some process is running or not etc...
- Note: you don't need any root or ansadmin access for these kind of operations
