

block & rescue and always

- Blocks and rescue work together to provide error-handling capabilities in Ansible.
 - Its like try and except blocks in programming/scripting languages
 - So, rescue executes if any error or exception in block
 - always is used to execute any task always
-
- There is one more advantage with block , that is we can group multiple tasks under one block, and we can provide a common condition/privilege escalation for block instead of providing in task level
